dubbo 这个动态编译， 会用在什么地方？

答：protocol 的 adaptive 自动生成类的动态编译

灭霸詹的关门弟子:21:49:31

classloader 是谁

答

```
/**
 * AdaptiveCompiler. (SPI, Singleton, ThreadSafe)
 */
@Adaptive
public class AdaptiveCompiler implements Compiler {

    private static volatile String DEFAULT_COMPILER;

    public static void setDefaultCompiler(String compiler) {
        DEFAULT_COMPILER = compiler;
    }

    @Override
    public Class<?> compile(String code, ClassLoader classLoader) {
        Compiler compiler;
        ExtensionLoader<Compiler> loader = Extension
            String name = DEFAULT_COMPILER; // copy refe
            if (name != null && name.length() > 0) {
                compiler = loader.getExtension(name);
            } else {
                compiler = loader.getDefaultExtension();
            }
            return compiler.compile(code, classLoader);
        }
    }
}
```
